

The Chair of Operations Management, in cooperation with Munich Airport, is offering a

Project Study

on the topic

Developing a model for dynamically determining distances and travel times on the airfield at Munich Airport

Scope

Knowledge of the distances and travel times between aircraft handling positions is necessary for the efficient execution of ground handling processes at Munich Airport. Currently, this data is not directly available. As part of the project study, a model is to be developed based on the location information available in CAD systems and existing distance information for subsets of the locations in order to be able to generate distances and travel times dynamically. Factors such as waiting times at intersections and different vehicle speeds should be taken into account. The model should then be implemented using a suitable programming language such as Python.

Requirements

- Interest in air traffic and airports
- Basic knowledge of Operations Research
- Programming skills
- Basic knowledge of CAD programs.
- IT skills
- Reliability and resilience

Start and duration: Immediately; duration: 3 months full-time, longer for part-time work

Language: German (preferred) or English

Number of participants: 2-4

Supervisor: Prof. Dr. Rainer Kolisch, Deepthi Cherullil Padinjaroot (MSc.)

Supervisor Airport Munich: Mr. Martin Bertling

Contact: If you are interested, please contact rainer.kolisch@tum.de
